## WORLD ECONOMIC GROWTH TO PICK UP ONLY GRADUALLY

*Klaus-Jürgen Gern, Philipp Hauber, Stefan Kooths and Ulrich Stolzenburg*

During the first half of the year global growth remained sluggish. While activity in emerging economies stabilized, growth in advanced economies softened. Over the next two years, we expect the world economy to pick up pace gradually, although without turning into a strong synchronized global upturn. World GDP at PPP exchange rates is set to expand by 3.1 percent this year, the same rate as in 2015. For next year, we continue to expect the world economy to grow by 3.5 percent; for 2018, we expect a further acceleration of global growth to 3.7 percent. Monetary policy remains accommodative in advanced economies and fiscal policy is getting more expansive. But structural impediments to growth as well as political uncertainty in the wake of rising protectionist and isolationist tendencies—as manifested, for example, in the UK’s decision to leave the EU—stand in the way of a more dynamic economic expansion. With commodity prices firming and China’s economy stabilizing, the outlook for many emerging economies has improved. However, we do not expect a swift recovery due to structural reasons as well as weak growth in advanced economies.

- Global growth remained sluggish.** The global economy accelerated only slightly from the low growth rates recorded last winter. Advanced economies even saw growth rates fall during the first half of the year. In the US, the expected recovery from a weak first quarter failed to materialize, while growth slowed markedly in the euro area and in Japan. At the same time, the outlook for the emerging economies has started to improve with the Chinese economy picking up in response to renewed government stimulus.
- The vote for Brexit will slow growth in the United Kingdom markedly and affect the outlook for the rest of the world, mainly via trade linkages.** While financial market volatility increased only briefly after the shock of the vote to leave the EU, we nevertheless expect growth in the UK to be substantially affected by the uncertainty regarding the future institutional framework. Via trade linkages this will spread to other countries, although the overall impact should be moderate in most countries. However, there is a risk that the British vote to leave the EU will trigger discussion about EU membership in other countries as well, and if a break-up of the EU became a realistic scenario, business and consumer confidence could be severely hit resulting in lower economic growth on a wider scale.
- Isolationist and protectionist ideas are gaining ground.** The vote for Brexit is part of a broader trend towards increased emphasis of national sovereignty. This is reflected in growing support for protectionist and structurally conservative policies threatening the foundations of the multilateral trade architecture and, more generally, complicating international cooperation to solve global problems. Uncertainty regarding future economic policies may already be weighing on investment today and could become a serious threat to the world economy further down the road.

**Figure 1:**  
World economic activity, 2007–2016

Quarterly data, seasonally adjusted. Indicator is based on business expectations in 42 economies. GDP: price adjusted, change over previous quarter.

Source: OECD, *Main Economic Indicators*; national sources; own calculations.

- **Macroeconomic policies remain conducive to growth.** Oil prices have stabilized and look set to increase moderately over the forecast horizon. Monetary policy in advanced economies has effectively been loosened further over recent months, in part as an effort to calm markets after the Brexit vote. Long-term interest rates have fallen further. The Fed is expected to be extremely slow in further tightening her policy, and other central banks will over the forecast horizon stick to their expansionary course. Fiscal policy will also provide stimulus: after the reduction of structural budget deficits have already come to a standstill in the recent past, fiscal policy looks to become more and more expansionary over the coming years.
- **Outlook: Growth will accelerate but economic momentum should remain subdued.** The world economy—measured at PPP exchange rates—will expand by 3.1 percent this year. Over the next two years growth will accelerate to 3.5 and 3.7 percent, respectively. At market exchange rates, growth rates will be roughly three quarters of a percentage point lower. Growth in world trade will slow yet again this year before accelerating slightly in 2017 and 2018 to 2.5 and 3 percent, respectively.
- **Growth in advanced economies will pick up gradually.** In the remainder of 2016 the US economy is expected to overcome the recent soft patch with private investment returning to growth and consumption continuing to rise solidly. We expect US GDP to grow by 2.4 and 2.5 percent in 2017 and 2018, respectively, after expanding by 1.6 percent this year. The expansion of the Japanese economy will temporarily accelerate to 1.2 percent next year on the back of significant fiscal stimulus. Growth in Europe will decrease slightly to 1.6 percent in 2017 mainly due to the ramifications of Brexit. For 2018, we forecast an acceleration to 1.9 percent.
- **The outlook for emerging economies is improving but growth is still being held back by structural impediments.** The Chinese government has undertaken sizeable measures to support demand. While they may increase the risks to stability in the longer term, the policy stimulus should stabilize growth above 6 percent in the short term. Latin American economies are set to benefit from recent increases in commodity prices. The Russian economy will continue to recover, although growth rates should remain moderate given the prevailing weaknesses in the domestic institutional environment.
