

# KIEL INSTITUTE ECONOMIC OUTLOOK

## World Economy Winter 2021

Finalized December 16, 2021

No. 85 (2021 | Q4)

Klaus-Jürgen Gern, Stefan Kooths, Jan Reents und Ulrich Stolzenburg

#### TEMPORARY SLOWDOWN

Klaus-Jürgen Gern, Jan Reents, Stefan Kooths und Ulrich Stolzenburg

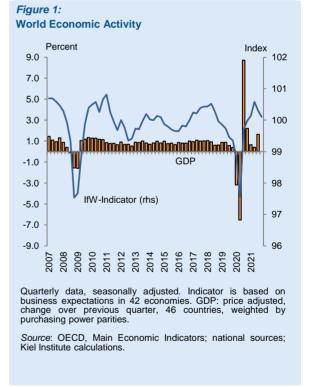

Following an encouraging first half of the year, the recovery of the global economy has lost momentum. Across the globe, resurging Covid-19 infections weighed on economic activity. Supply chain disruptions prevented a further expansion of global industrial production, and the fast-moving recovery of the Chinese economy almost came to a sudden stop. The impact that the Omicron variant of the coronavirus will have on output remains uncertain at this stage. Over the next few months, we expect economic growth to be rather subdued before picking up again in 2022. We forecast global output (measured on a purchasing power parity basis) to increase by 5.7 percent in 2021 and 4.5 percent in 2022, representing a downward revision of our previous forecast by 0.2 and 0.5 percentage points for 2021 and 2022, respectively. For 2023, we have increased our forecast modestly from 3.8 percent to 4.0 percent. Inflation is thought to have peaked as the contribution of the energy component to overall inflation is expected to decline considerably going forward. Nonetheless, upward pressures on prices are expected to persist given continued supply constraints, and inflation rates will likely remain well above their respective pre-Covid levels.

The economic recovery has lost momentum. Global output (measured on a purchasing power parity basis) has increased significantly during the third quarter. However, this has been largely due to a re-

bound of India's economy from a slump in activity due to another lockdown in spring. In the rest of the world, economic activity slowed down in the second half of the year, which is also reflected in the IfW-indicator for global economic activity, which tracks sentiment indicators in 42 countries (Figure 1).

The Covid-19 pandemic still has an impact on economic activity but waves of infections are spreading at different speeds across countries. Covid-19 affects individual economies differently. Countries that benefit from high vaccination rates are tolerating much higher infection rates before considering restrictive measures to contain the virus. In this respect, the new Omicron variant does bear some additional risk for global growth. In addition to the pandemic, supply chain disruptions and surging inflation have clouded the economic outlook.

Supply chain problems slow down global trade and industrial production. In 2021, growth of industrial production has come to a halt. Supply bottlenecks have been a major factor behind the stag-

nating trend in industrial production. An increased share of goods blocked in waiting lines in major harbours (Figure 2) is an indication of capacity constraints in global transport which are contributing to the slowdown. Moreover, manufacturing capacities have proven to be insufficient to meet strong overall demand. The shortage of semiconductors is case in point and has affected the automotive industry in particular, with global automobile production having declined by about 30 percent during 2021. Given the size of the automotive industry, this represents a major drag on global economic output.

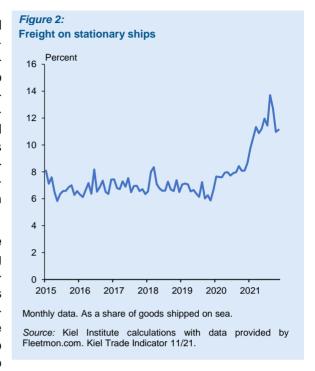

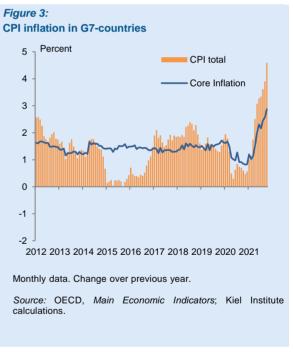

Inflation has been surging across developed economies. Inflation rates have increased significantly over the course of 2021, often reaching multidecade highs. Inflation in the G-7 has climbed to around 5 percent (Figure 3). From December onwards, the trend is expected to reverse as the contribution of the energy component, which accounted for approximately half of the increase in inflation, is expected to decline. However, core inflation (excluding food and energy) has also increased substantially and is now exceeding inflation targets in most countries.

Energy prices have increased strongly but are expected to slowly retreat within our forecasting horizon. During recent months, gas prices in particular rose dramatically and pulled up oil prices as well. The price of oil increased to 85 dollar per barrel, its highest price since 2014 (Figure 4). Over the forecast horizon, we expect commodity prices to slightly retreat as demand remains subdued due to the pandemic whereas supply should be supported by the current high level of commodity prices.

Monetary policy is tightening. The Federal Reserve and the Bank of England have both already prepared markets for an acceleration of the pace of their monetary tightening. Interest rates are expected to be raised in the first half of 2022 provided that the economy remains on track despite Omicron. In the euro area, an interest rate increase is not yet in sight, but asset purchases will be reduced when pandemic emergency bond buying program expires in March 2022. Developing countries have already been raising interest rates since mid-2021 in order to address growing concerns about inflation and stem downward pressure on their exchange rates.

**Fiscal policy remains supportive.** In light of resurging waves of infections, fiscal policy has continued to support the expansion. While efforts to contain the economic fallout of the pandemic will be re-

duced as economic activity is progressively normalizing, the focus of fiscal policy has shifted towards public investments and programs addressing the structural challenges that countries are facing (e.g. climate change or aging societies). Any slowdown resulting from the discontinuation of fiscal support programs relating to the pandemic should therefore be limited.

#### **Outlook:**

Taballa 4

#### Recovery of the global economy temporarily subdued

The pandemic and global supply chain disruptions will continue to weigh on growth, but the negative impact will diminish. Economic momentum in the world economy has slowed in 2021 as a consequence of resurging Covid-19 cases and far-reaching supply chain problems. We expect that new waves of infections will continue to spread over the next coming months, in particular given the rise of the more contagious Omicron variant. The consequences for economic activity, however, should become less severe going forward. Sectors that have been lagging, e.g. the tourism or entertainment industries, will continue to recover over the forecasting horizon, although we have revised down the pace of normalization. Supply bottlenecks are expected to fade as manufacturing capacities are being increased and supply chains are adjusted. We forecast global output (measured on a purchasing power parity basis) to increase by 5.7 percent this year and 4.5 percent in 2022 (Table 1). Compared to our September forecast, we have reduced our estimates by 0.2 percentage points for 2021 and 0.5 percentage points for 2022. For 2023, we have increased our forecast modestly from 3.8 percent to 4.0 percent. World output measured market exchange rates should increase by 5.6 percent this year and 4.4 and 3.7 percent in 2022 and 2023, respectively. World trade in goods is set to increase by more than 9 percent in 2021, but trade growth will reduce to 2.2 percent in 2022 before increasing to 3.5 percent in 2023.

In the United States, the economic expansion remains strong and inflation exceeds the central bank target. The slowdown of growth to 0.5 percent in the third quarter was to a large extent due to temporary factors, and the fourth quarter is likely to see a rebound. For the full year 2021, GDP is likely to increase by 5.6 percent. US fiscal policy remains expansive even though the volume of the most recent programs appears modest compared to earlier programs. Monetary policy will be gradually tightened, but nevertheless continue to support the expansion over the next two years. We expect GDP to increase by 4.7 percent in 2022 and 2.9 percent in 2023 and thus by rates above the estimated rate of potential output (Table 2). While the impact of energy prices on inflation will diminish, rising capacity utilization will add to inflationary pressures and inflation rates will remain above target.

Following a setback in the autumn and winter, the recovery in the Euro area will pick up again in spring. In response to spiraling Covid-19 infections in Europe, containment measures have again been put in place. As a result, private consumption has been impaired with personal services being affected most severely. For the fourth quarter of 2021 and the first quarter of 2022, we expect economic output to decline slightly. At the same time, industrial production remains impaired by supply chain disruptions. Going forward, however, supply chain problems should gradually dissolve, allowing manufacturing output to expand considerably in 2022. Following an increase of GDP of 5.0 percent in 2021, we expect growth of 3.5 percent and 3.1 percent in 2022 and 2023, respectively. Inflation will rise to 2.8 percent next year, before gradually declining again to 1.9 percent in 2023.

A real estate crisis and Covid-19 push growth in China below 5 percent. The Chinese economy has slowed markedly over 2021 due to a number of factors. While energy shortages which constrained output particularly in the third quarter, appear to have been largely resolved following a ramp-up in energy supply and improved incentives for electricity production, other elements will continue to affect growth in China over a longer term. Containment measures can be expected to restrain activity as long as the rigid no-Covid policy remains in place. The consolidation of the real estate sector will likely have an even more severe and lasting influence on the economy. All in all, we expect growth rates to remain substantially below Chinas pre-Covid levels for the foreseeable future.

Omicron is a risk for the global economic recovery. The appearance of the Omicron variant of the Covid-19 virus has raised the risk of a pronounced economic downturn, as it is considered to be highly contagious and vaccinations appear to be less effective. There is a concern that another bout of long-lasting and pronounced restrictions and behavior adaptations could lead to persistent damages in the most affected industries.

**Tighter monetary conditions across advanced economies could derail the recovery in emerging economies.** Until recently, emerging economies have been mostly struggling with the impact of the pandemic, while financial conditions have been generally favorable and high commodity prices a stimulating factor. At the current juncture, we expect the recovery in the developing and emerging economies to overall continue. However, tightening of monetary policy in the United States may lead to capital outflows from emerging economies and put downward pressure on their exchange rates. Many central banks in emerging economies have already increased interest rates and, with interest rates in the US rising, they could find themselves in the position to have to tighten their policy beyond what would be appropriate from a purely domestic point of view.
